STRAIN=Sprague Dawley; TISSUE=Ovary; STRAIN=Sprague Dawley; TISSUE=Ovary; MEDLINE=95129487; pubMed=7828536; Tilly J.L., Tilly K.I., Kenton M.L., Johnson A.L.; "Expression of members of the bcl-2 gene family in the immature rat ovary: equine chorionic gonadotropin-mediated inhibition of granulosa cell apoptosis is associated with decreased bax and constitutive bcl-2 and bcl-xlong messenger ribonucleic acid levels."; Endocrinology 136:232-241(1995). [3] SEQUENCE OF 19-172 FROM N.A. MEDLINE=95059917; pubMed=7969891; Castren E., Ohga Y., Berzaghi M.P., Tzimagiorgis G., Thoenen H., Lindholm D.; "bcl-2 messenger RNA is localized in neurons of the developing and adult rat brain."; "bcl-2 messenger RNA is localized in neurons of the developing and adult rat brain."; Neuroscience 61:165-177(1994)!- FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAP-1)!- SUBUNIT: Forms homodimers, and heterodimers with BAX. BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptocic activity (By similarity)!- SUBCELULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum!- TISSUE SPECIFICITY: Expressed in a variety of tissues, with highest levels in reproductive tissues. In the adult brain, expression is localized in mitral cells of the olfactory bulb, granule and pyramidal neurons of hippocampus, pontine noclei, cerebellar granule neurons, and in ependymal cells. PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol promoting further caspase activity (By similarity).

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            European Bioinformatics Institute. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               brain, expression is higher and in the cortical plate.
DOMAIN: The BH4 domain is r for interaction with RAF-1

```
release. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochnodria and/or by binding to the apoptosis-activating factor (APAF-1) (By similarity).

Forms homodiners, and heterodimers with BAX, BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity).

SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum.

DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity).

Form: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle (By similarity). In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases (By similarity). Dephosphorylated by protein phosphatase 2A (PP2A) (By similarity). Companis the BH4 domain, has pro-apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptosis. The similarity: Companis 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.

FINILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.

FINILARITY: CONTAINS 1 BCL-2 HOMOLOGY 4 (BH4) DOMAIN.

SUBBELLULAR LOCATION: Membrane-bound (Potential).
DEVELOPMENTAL STAGE: DEVELOPMENTAL REGULARION ONLY OCCURS IN
BRAIN OF MID-METAMORPHOSIC TO POST-METAMORPHOSIC TADPOLES AN
ADULTS, WHERE AN INCREASE OF SEVERAL FOLD HAS BEEN OBSERVED.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.

                                                                                                    BCl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCELLUIAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum. TISSUE SPECIFICITY: In adult chicken expressed, in thymus, spleen, kidney, heart, ovary and brain, with the highest levels in the thymus. In the embryo, highly levels expressed in all tissues with
DOMAIN: The BH4 domain is required for anti-apoptotic for interaction with RAF-1 (By similarity).
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the apoptosis-activating factor (APAF-1).
SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and BC1-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1.
SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular subscriptions of the nuclear envelope and the endoplasmic reticulum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoletic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding the caspases.
                                                                                                                                                                                                                                                                                                                                                           ween the Swiss Institute of Bioinf

TISSUE SPECIFICITY: Expressed in a variety of tissues.
DOMAIN: The BH4 domain is required for anti-apoptotic activity for interaction with RAF-1.
                                                                                                                                                                                                                                                                                                                                                                                                            DATABASE: NAME-Atlas Genet. Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by binding to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane. The Bcl-x(S)

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 4
                                                                                                                                                                        ALTERNATIVE PRODUCTS: 3 ISOFORMS; BCL-X(L) (SHOWN HERE), BCL-X(S) AND BCL-X(BETA); ARE PRODUCED BY ALTERNATIVE SPLICING. TISSUE SPECIFICATY: EXPRESSED IN MOST TISSUES. BCL-X(BETA) IS SPECIFICALLY EXPRESSED IN CEREBELLUM, HEART, AND THYMUS. IN THE OVARY, THE PREDOMINANT FORM IS BCL-X(L), WITH A SMALL BUT DETECTABLE LEVEL OF BCL-X(S).
                                                                                                                                                                                                                                                                                                 cytochrome c, from the mitochondrial membrane. The Bcl-x($) are Bcl-x(beta) isoforms promote apoptosis.
SUBUNIT: Bcl-x(L) forms heterodimers with BAX, BAK and Bcl-2 (similarity). Heterodimerization with BAX does not seem to be required for anti-apoptotic activity (By similarity).
SUBCELLULAR LOCATION: MITOCHONDRIAL MEMBRANES AND PERINUCLEAR
                                                                                                                       DOMAIN: The BH4 domain is required for anti-apoptotic activity. The BH1 and BH2 domains are required for both heterodimerization with other Bc12 family members and for repression of cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: Potent inhibitor of cell death. Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                             FUNCTION: Potent inhibitor of cell
                                                                                        cleaved protein,
                                                                                                                                                                                                                                                                                    ENVELOPE (BY SIMILARITY)
                                                                                                                                                                                                                                                                                                                                                                                                          to it and preventing the release of the caspase
                                                                                                        Proteolytically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (JUN-1995) to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (DEC-1994)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              , Kunishima N., Inohara N., Ishibashi Y.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        T.M.;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   David

TISSUE SPECIFICITY: BCL-X(S) IS EXPRESSED AT HIGH LEVELS IN CELLS THAT UNDERGO A HIGH RATE OF TURNOVER, SUCH AS DEVELOPING LYMPHOCYTES. IN CONTRAST, BCL-X(L) IS FOUND IN TISSUES CONTAINING LONG-LIVED POSTMITOTIC CELLS, SUCH AS ADULT BRAIN.

DOMAIN: The BH4 domain is required for anti-apoptotic activity. DOMAIN: The BH4 domains are required for both heterodimerization with other Bcl2 family members and for repression of cell death. DTM: Proteolytically cleaved by caspases during apoptosis. The

. Mol. Cell. Cardiol. 31:147-158(1999).

-!- FUNCTION: Potent inhibitor of cell death. Inhibits activate caspases (By similarity). Appears to regulate cell death belocking the volatage dependent anion channnel (VDAC) by be to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane.

-!- SUBUNIT: Bcl-x(L) forms heterodimers with BAX, BAK and Bcl

-i FUNCTION: ACCELERATES PROGRAMMED CELL DEATH BY BINDING TO, AN ANTAGONIZING THE APOPTOSIS REPRESSOR BCL-2 OR ITS ADENOVIRUS HOMOLOG E1B 19K PROTEIN. INDUCES THE RELEASE OF CYTOCHROME C. ACTIVATION OF CASPASE-3, AND THEREBY APOPTOSIS.

-i- SUBUNIT: FORMS HOMODIMERS AND HETERODIMERS TOGETHER WITH BCL-E1B 19K PROTEIN, BCL-X(L), MCL-1 AND A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=93364978; PubMed=8358790; Oltvai Z.N., Milliman C.L., Korsmeyer "Bcl-2 heterodimerizes in vivo with a accelerates programmed cell death."; Cell 74:609-619(1993).

                                                                                                                                                FUNCTION: CONFERS STRONG PROTECTION AGAINST CELL DEATH.
SUBCELLULAR LOCATION: Membrane-bound (POtential).
DEVELOPMENTAL STAGE: DEVELOPMENTAL REGULATION ONLY OCCURS IN
BRAIN OF MID-METAMORPHOSIC TO POST-METAMORPHOSIC TADPOLES AN
ADULTS, WHERE AN INCREASE OF SEVERAL FOLD HAS BEEN OBSERVED.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ALCTKVPELIRTIMGWTLDFLRERLLGWIQDQGGWDGLL
